

Etera Sedum Cuttings - Plant Care

Congratulations! You have just received some of the highest quality sedum cuttings available, with a few simple steps, your Etera Sedum Cuttings will flourish.

Upon receipt of your shipment:

- Keeping the cuttings cool before planting is critical.
- Immediately move the boxes out of direct sun.

Unopened boxes left in the hot sun can ruin your cuttings in minutes:

- Gently stir and lift, allowing air to reach all of the cuttings in the box.
- Leave the boxes opened, in the shade, keeping them as cool as possible until planting.

If freezing conditions are expected:

- The boxes may be closed again to provide protection.
- Do not allow your cuttings to freeze.

If it is very hot:

- A light spray of water over the boxes can help cool them, but be careful not to wet them completely.
- Spraying water on the ground and surfaces around the boxes will greatly increase cooling.

Before planting cuttings on the roof:

- Water the soil.
- Provide a cool, moist bed to receive the cuttings.

After spreading the cuttings:

- Gently press them into the soil with a light roller or with careful raking.
- Many times a light fiber mulch or hydromulching can be beneficial.
- If mulching is not possible, the cuttings can also be topped with 1/4" of 1/1 blend of topsoil or compost and sand.
